                                           -:- FUNCTION: The numerous interruptions in the triple helix may make this molecule either elastic or flexible.
-:- TISSUE SPECIFICITY: In the placenta, where it is found in the amnion, a membranous itssue lining the amniotic cavity. Within the amnion, it is found in an acellular, relatively dense layer of a complex network of reticular fibers. Also located to a fibroblast layer beneath this dense layer. Exists in tissues in association with other types of collagen.
-:- DEVELOPMENTAL STAGE: Transfently elevated expression during
                                                                                                                                                                                                                                                                                                       gestation, and decrease at term.

-1- DOMAIN: This sequence defines eighteen different domains, nine triple-helical domains (COL9 to COL1) and ten nontriple-helical domains (NC10 to NC1).

-1- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
-1- SIMILARITY: Belongs to the fibril-associated collagens with interrupted helices (FACIT) family.
-1- SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TSP N-terminal.

-!- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
-!- DISEASE: Defects in COL9A2 are the cause of multiple epiphyseal dysplasia associated with significant morbidity. Oint pain, joint deformity, waddling gait, and short stature are the main clinical signs and symptoms. EDM is broadly categorized into the more severe Fairbank and the milder Ribbing types. EDM2 inheritance is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDILINE=9340300; Pubmed=10411504; DOI=10.1126/science.285.5426.409; Amnunen S., Paassilta P., Lohiniva J., Peraelae M., Pihhajamaa T., Karppinen J., Tervonen O., Kroeger H., Laehde S., Vanharanta H., Ryhanen L., Goering H.H.H., Ott J., Prockop D.J., Ala-Kokko L.; "An allele of COL9A2 associated with intervertebral disc disease."; "An allele of COL9A2 associated with intervertebral disc disease."; Science 285:409-412(1999).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -i. SUBUNIT: Heterotrimer of an alpha 1(\mathrm{IX}), an alpha 2(\mathrm{IX}) and an alpha 3(\mathrm{IX}) chain.
                                                                                                                         "Human COL9A1 and COL9A2 genes. Two genes of 90 and 15 kb code for similar polypeptides of the same collagen molecule.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           autosomal dominant.

DISEASE: Defects in COL9A2 may be a cause of susceptibility to intervertebral disc disease (IDD) [MIM:603932]. IDD is one of most common musculo-skeletal disorders.

SIMILARITY: Belongs to the fibril-associated collagens with interrupted helices (FACIT) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                InterPro; IPR008161; Clg helix.

                                                      meshwort together with laminins, proteoglycans and meshwort together with laminins, proteoglycans and entactin/nidogen.
SUBUNIT: There are six type IV collagen isoforms, alpha 1(IV)-
alpha 6(IV), each of which can form a triple helix structure with Cother chains to generate type IV collagen network.
DOMAIN: Alpha chains of type IV collagen have a noncollagenous domain (IVI) at their C-terminus, frequent interruptions of the G-
X-Y repeats in the long central triple-helical domain (which may cause flexibility in the triple helix), and a short N-terminal triple-helical 7S domain.
                                                                                                                                                                                                            PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

PTM: Type IV collagens contain numerous cysteine residues which are involved in inter- and intramolecular disulfide bonding. 12 of these, located in the NCI domain, are conserved in all known type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3D-structure, Basement membrane, Collagen, Direct protein sequencing; Extracellular matrix; Glycoprotein; Hydroxylation; Repeat; Signal;
                                                                                                                                                                                                                                                                                                 M: The trimeric structure of the NC1 domains may be stabilized covalent bonds between Lys and Met residués.
covalent Met-Lys cross-link.";
Proc. Natl. Acad. Sci. U.S.A. 99:6607-6612(2002).
-!- FUNCTION: Type IV collagen is the major structural component of
glomerular basement membranes (GBM), forming a 'chicken-wire'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GO:0005587; C:collagen type IV; TAS.

J. Cell Biol. 114:1573-1582(1996).

Controlling lateral growth of collagen II fibrils (By similarity).

SUBUNIT: Trimers composed of three different chains: alpha 1(XI), alpha 2(XI), and alpha 3(XI). Alpha 3(XI) is a post-translational modification of alpha 1(II). Alpha 1(V) can also be found instead of alpha 3(XI)=1(II) (By similarity).
                                                                                                                                                                                                                                                                                                                                               Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

-!-SUBUNIT.Trimers of identical alpha 1(III) chains. The chains ar linked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylysines.
-!-PTM: O-glycosylated (By similarity).
-!-PTM: prollines at third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MUCLEOTIDE SEQUENCE.

-!- FUNCTION: Collagen type III occurs in most soft connective tissues along with type I collagen. PTM: O-linked glycan consists of a Glc-Gal disaccharide bound to the oxygen atom of a post-translationally added hydroxyl group (By similarity). SUBUNT: Trimers of identical alpha 1(III) chains. The chains are linked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylyaines.

PTM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the MEDLINE=88167858; PubMed=3443309; DOI=10.1016/0378-1119(87)90117-X; Wood L., Theriault N., Vogeli G.; "Complete nuclectide sequence of the N-terminal domains of the murine alpha-1 type-III collagen chain."; ene 61:225-230(1987).
